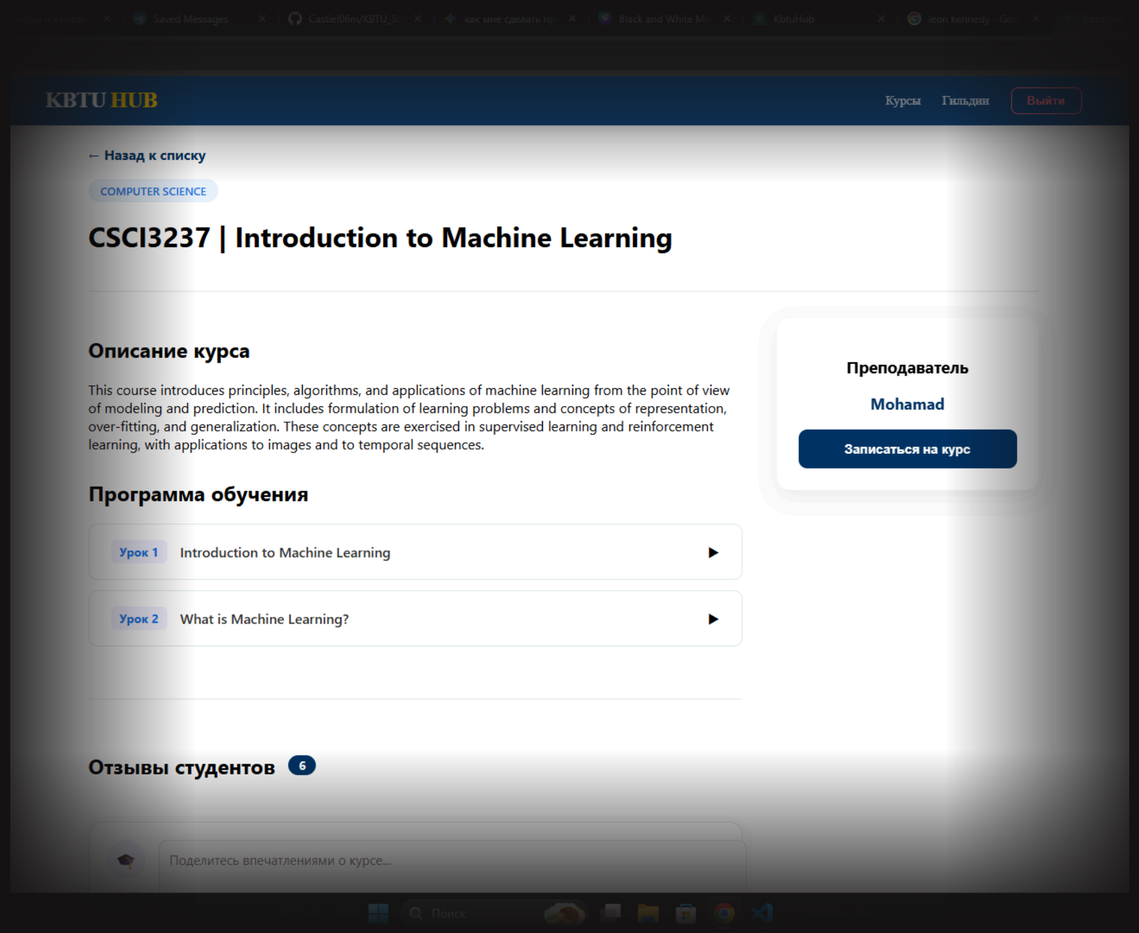
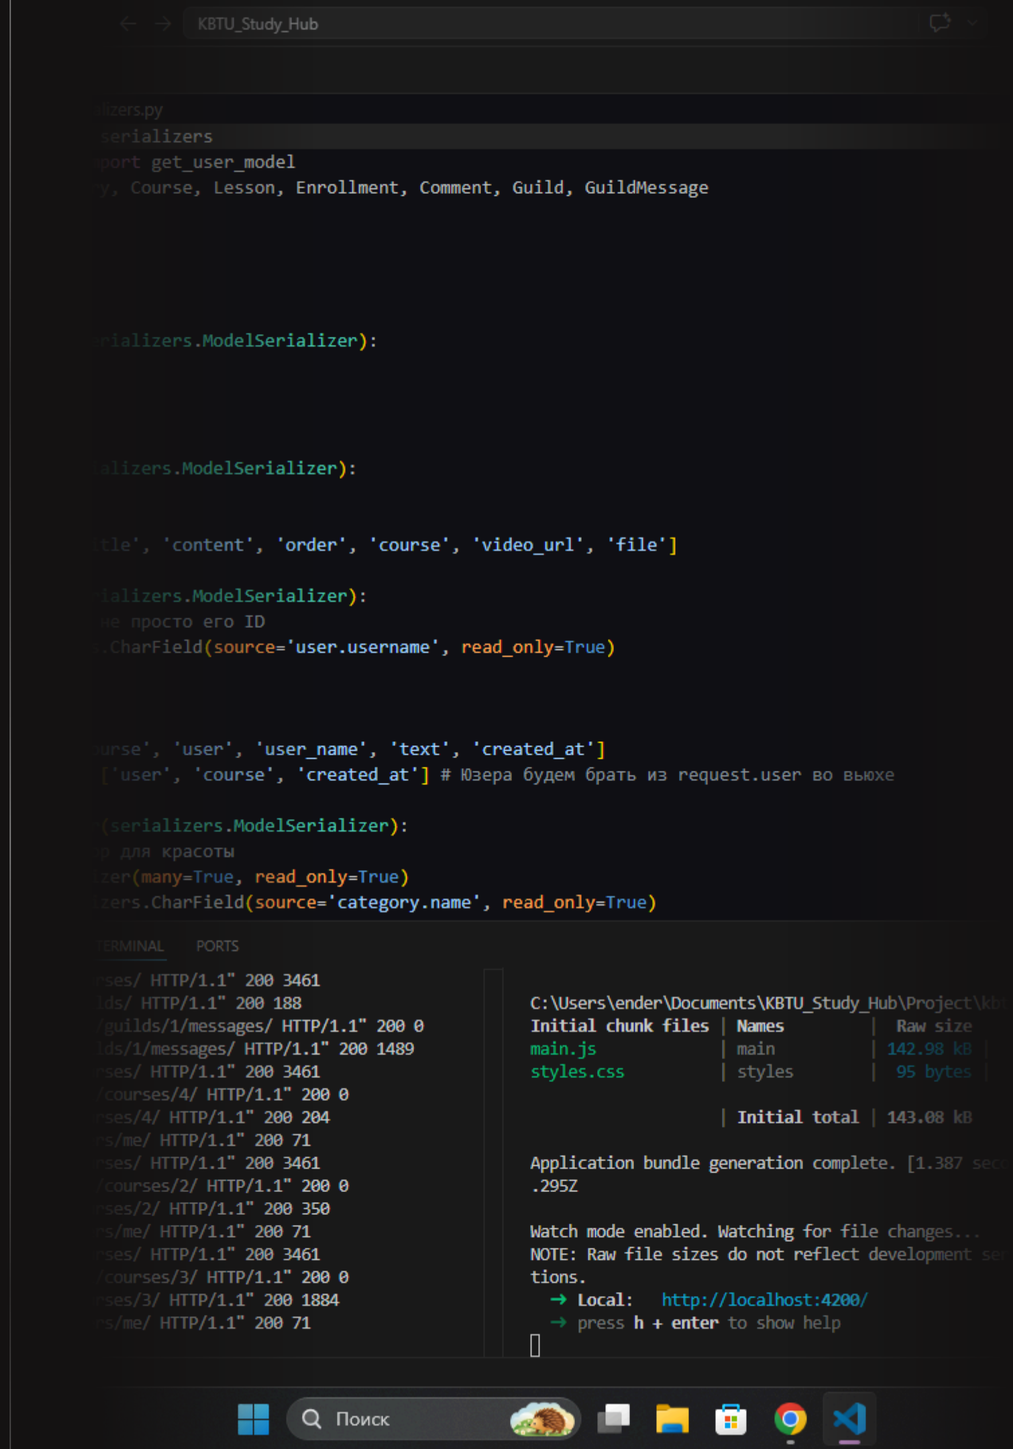
Introduction



KBTU Study Hub is a project that was, of course, created mainly to earn points, but at the same time it has something heartfelt about it – for example, the authors' comments or this presentation



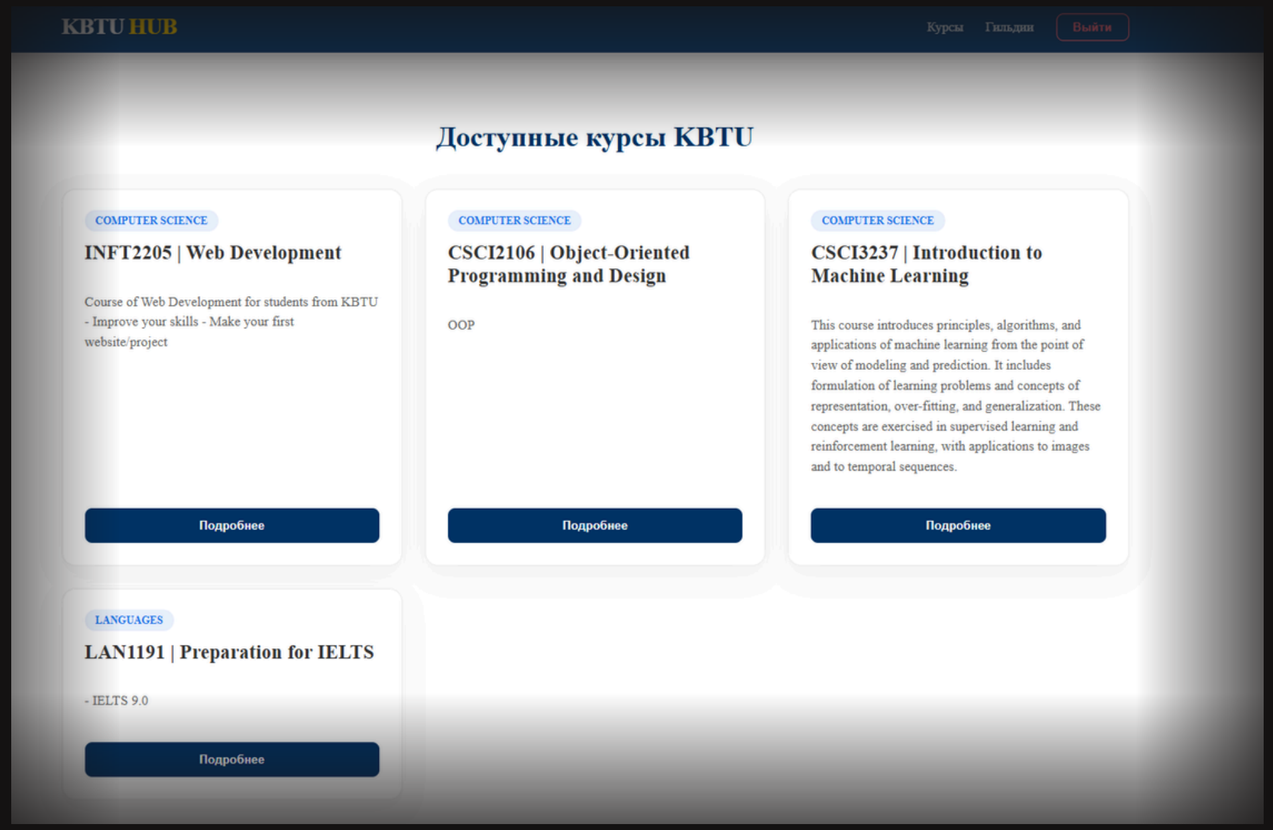
The project is a modern web application in which Django serves as the server-side framework, handling business logic and data stored in an SQLite database. The entire user interface is built using Angular, which displays information by exchanging data with the server via fast API requests

This project implements all the typical core functionality: separating accounts into teachers and students, the ability to create courses and comment on them, and it also features smooth animations to enhance the overall user experience

Discussion

One of the interesting features of the project is the implementation of a guild system – that is, chats for discussing various topics with the ability to attach files

End



We hope this presentation was useful for you. Thank you for your attention
